Commercial Treatment—Failure of Cotton Culture.

A farmer in this vicinity who was planning to plant cotton, had some of his fields treated with a dust disinfectant, but failed to get a good stand. The reason is that the commercial treatment did not kill the weeds in the field. The treatment was applied with too much nitrogen, thus muffling the germination of the cotton seeds, and old weeds started before the cotton became strong enough to compete with them.

It is important to know the conditions under which the treatment is to be used. It is best to test the soil before treating, and to use a dust disinfectant that is known to be effective in the area.

It is also advisable to use a dust disinfectant that is known to be effective in the area, and to use a treatment that is known to be effective in the area.
